## Parliamentary election

Voting simulations for the electoral reform

## The National Assembly

Welcome to the French National Assembly...

By Richard Ying and Tangui Morlier - Personal work, CC BY-SA 3.0, https://commons.wikimedia.org/w/index.php?curid=17800606

## The official parliamentary election

- 577 deputies
- Two-round majority by circonscription

## The official parliamentary election

- 577 deputies
- Two-round majority by circonscription
- $>50 \%$ of valid votes and $>25 \%$ of registered voters $\Rightarrow$ elected
- $>12.5 \%$ of reg. voters $\Rightarrow 2^{\text {nd }}$ round
- if this rule does not select at least 2 candidates, then the two candidates with highest plurality score go to the $2^{\text {nd }}$ round
- $2^{\text {nd }}$ round: plurality voting

## Let's play a game...

What would have happened if:

- the number of deputies is reduced?
- some amount of proportionality is introduced?

Run computer simulations to replay the match. You have 1 month++.

## Team

- Renaud Blanch, LIG, Université Grenoble-Alpes
- Sylvain Bouveret, LIG, Université Grenoble-Alpes

Contributions of:

- Jérôme Lang, LAMSADE CNRS, Université Paris-Dauphine
- Bruno Cautrès, CNRS, CEVIPOF - Centre de recherches politiques de Sciences Po.

Previous report:
클 Cohendet, M.-A., Lang, J., Laslier, J.-F., Pech, T., and Sawicki, F. (2018).
Une "dose de proportionnelle" : pourquoi ? comment ? laquelle ?
Technical report, Terra Nova.

## Datasets

- Official results (Ministère de l'Intérieur)
- per circonscription (electoral district)
- per canton
- Geographic boundaries
- circonscriptions: Atelier de cartographie de Sciences Po.
- cantons: IGN
- départements: IGN Geofla

## Parliamentary election

Back to basic: proportionality?

## Of parties and districts

- One vote $=$ one district + one party

| Voter | District | Party |
| :--- | :--- | :--- |
| Voter \#1 | Circ. 1 | LREM |
| Voter \#2 | Circ. 1 | FI |
| Voter \#3 | Circ. 1 | LREM |
| Voter \#4 | Circ. 1 | LR |
| Voter \#5 | Circ. 2 | PS |
| Voter \#6 | Circ. 2 | PS |
| Voter \#7 | Circ. 2 | EELV |
| Voter \#8 | Circ. 3 | EELV |

## Majoritarian rule

- Current rule: priority $=$ district. Principle: 1 district $=1$ deputy
- May totally ignore the representation of parties

Quiz: Can you imagine a situation where one party wins all the seats in the parliament with only $12.5 \%$ of the votes?

## Majoritarian rule

- Current rule: priority $=$ district. Principle: 1 district $=1$ deputy
- May totally ignore the representation of parties

## Quiz: Can you imagine a situation where one party wins all the seats in the parliament with only $12.5 \%$ of the votes?

At the other end of the spectrum, full proportionality totally ignores districts ( $=$ nation-wise election)

## Majoritarian rule

- Current rule: priority $=$ district. Principle: 1 district $=1$ deputy
- May totally ignore the representation of parties

## Quiz: Can you imagine a situation where one party wins all the seats in the parliament with only $12.5 \%$ of the votes?

At the other end of the spectrum, full proportionality totally ignores districts ( $=$ nation-wise election)

Mixed voting:

- Mixed voting tries to reconcile majoritarian and proportional vote
- There are a lot of ways to do it

## The apportionment problem

Similarities with the apportionment problem

| Name | Gender | Group | Age | Affiliation |
| :--- | :--- | :--- | :--- | :--- |
| Ann | F | A | J | L |
| Bob | M | A | J | E |
| Charlie | M | A | S | L |
| Donna | F | B | S | E |
| Ernest | M | A | S | L |
| George | M | A | S | E |

How to elect a committee that reflects the diversity of the population?
Example borrowed from [Lang and Skowron, 2018]

Lang, J. and Skowron, P. (2018).
Multi-attribute proportional representation.
Artificial Intelligence, 263:74-106.

## Parliamentary election

What did we simulate?

## Voting rules

- Current voting rule (two-round majority)
- Mixed rules (majority / proportional): $k$ seats allocated using the current rule / $n-k$ seats allocated proportionally to a vector $\left(p_{1}, \ldots, p_{n}\right)$ that depends on the method used
- Additive: proportions using raw party scores
- Compensatory: proportions using deputy deficits
- Corrective: proportions using vote deficits
- Mixed rule used for Senate

## Three mixed rules

## Additive rule

ECO obtains $4.3 \%$ of the votes and REM 28.2\%

- $p_{\text {ECO }}=4.3 \%$
- $p_{\text {REM }}=28.2 \%$ (no matter how much majority seats they have)

## Three mixed rules

## Additive rule

ECO obtains $4.3 \%$ of the votes and REM 28.2\%

- $p_{\text {ECO }}=4.3 \%$
- $p_{\text {REM }}=28.2 \%$ (no matter how much majority seats they have)

## Compensatory rule

ECO obtains 1 seat, but should obtain 24.811 in a fully proportional election $\Rightarrow$ deficit: 23.811
REM obtains 308 seats, but should obtain 162.714 in a fully proportional election $\Rightarrow$ deficit: -145.286

$$
\begin{aligned}
\text { - } p_{E C O} & =23.811 / \sum p_{i} \\
\text { - } p_{R E M} & =0
\end{aligned}
$$

## Three mixed rules

## Corrective rule

FI wins in 17 districts. The (spoiled) FI voters in the other 560 districts are $2,392,951$
REM wins in 308 districts. The (spoiled) FI voters in the other 269 districts are $1,714,010$

$$
\begin{aligned}
& \text { - } p_{F I}=2,392,951 / \sum p_{i} \\
& \text { - } p_{R E M}=1,714,010 / \sum p_{i}
\end{aligned}
$$

## About the remainders

The proportions do not yield integral numbers of deputies...

## About the remainders

The proportions do not yield integral numbers of deputies...

How to allocate the remainders?

## About the remainders

The proportions do not yield integral numbers of deputies...

How to allocate the remainders?

- d'Hondt method (highest average): order the parties by decreasing ratios votes / seats and allocate the remaining seats sequentially
- Hare method (highest remainder): order the parties by decreasing differences proportion - seats and allocate the remaining seats sequentially

## The core difficulties

Reducing the number of majoritarian deputies $\Rightarrow$ reducing the number of electoral districts

## The core difficulties

Reducing the number of majoritarian deputies $\Rightarrow$ reducing the number of electoral districts

- Redistricting: what will be the new districts?

## The core difficulties

Reducing the number of majoritarian deputies $\Rightarrow$ reducing the number of electoral districts

- Redistricting: what will be the new districts?
- $2^{\text {nd }}$ round prediction: who will win the new second rounds???

## The core difficulties

Reducing the number of majoritarian deputies $\Rightarrow$ reducing the number of electoral districts

- Redistricting: what will be the new districts?
- $2^{\text {nd }}$ round prediction: who will win the new second rounds???

Remark: a similar project: Dérangeons la Chambre (R. Magni-Berton, 2016)
http://www.derangeonslachambre.fr/
But does not simulate a reduction of the number of districts

## Redistricting

Three methods for redistricting:

- Manual (J. Lang): scenario with 404 districts

## Redistricting

Three methods for redistricting:

- Manual (J. Lang): scenario with 404 districts
- Statistical: random generation of artificial districts with the same statistical parameters than the actual ones

## Redistricting

Three methods for redistricting:

- Manual (J. Lang): scenario with 404 districts
- Statistical: random generation of artificial districts with the same statistical parameters than the actual ones
- Geographic merging:

## Redistricting

Three methods for redistricting:

- Manual (J. Lang): scenario with 404 districts
- Statistical: random generation of artificial districts with the same statistical parameters than the actual ones
- Geographic merging:
- Uniform reduction of the number of districts per department

## Redistricting

Three methods for redistricting:

- Manual (J. Lang): scenario with 404 districts
- Statistical: random generation of artificial districts with the same statistical parameters than the actual ones
- Geographic merging:
- Uniform reduction of the number of districts per department
- Uniform merging inside departments, with connectivity constraints (graph partitioning)

## Redistricting

Three methods for redistricting:

- Manual (J. Lang): scenario with 404 districts
- Statistical: random generation of artificial districts with the same statistical parameters than the actual ones
- Geographic merging:
- Uniform reduction of the number of districts per department
- Uniform merging inside departments, with connectivity constraints (graph partitioning)
- Circonscription or canton-based

## Redistricting by geographic merging

## $2^{\text {nd }}$ round prediction

Four methods for $2^{\text {nd }}$ round prediction:

- Naive: $2^{\text {nd }}$ round winner $=1^{\text {st }}$ round winner

## $2^{\text {nd }}$ round prediction

Four methods for $2^{\text {nd }}$ round prediction:

- Naive: $2^{\text {nd }}$ round winner $=1^{\text {st }}$ round winner
- Single-peaked: votes transfer to the closest candidate

## $2^{\text {nd }}$ round prediction

Four methods for $2^{\text {nd }}$ round prediction:

- Naive: $2^{\text {nd }}$ round winner $=1^{\text {st }}$ round winner
- Single-peaked: votes transfer to the closest candidate
- Empirical: transfer matrix (B. Cautrès, Cevipof)

## $2^{\text {nd }}$ round prediction

Four methods for $2^{\text {nd }}$ round prediction:

- Naive: $2^{\text {nd }}$ round winner $=1^{\text {st }}$ round winner
- Single-peaked: votes transfer to the closest candidate
- Empirical: transfer matrix (B. Cautrès, Cevipof)
- Learning model: carefully tuned linear predictor

## $2^{\text {nd }}$ round prediction

Four methods for $2^{\text {nd }}$ round prediction:

- Naive: $2^{\text {nd }}$ round winner $=1^{\text {st }}$ round winner
- Single-peaked: votes transfer to the closest candidate
- Empirical: transfer matrix (B. Cautrès, Cevipof)
- Learning model: carefully tuned linear predictor

Conclusion: the linear predictor seems to give the best results (but the validity of the method is very doubtful...)

## Parliamentary election

Results of the simulations

## Visualizing proportionality

Purely proportional voting rule, 577 deputies

## Visualizing proportionality

Purely majoritarian voting rule (current electoral system)

## Measuring proportionality

We use a metrics introduced by Loosemore and Hanby (1971):

## $p$ measure of proportionality

Sum for each party of the number of voters to add or remove to obtain full proportionality.
$\Leftrightarrow$ sum of the areas above and below the proportionality circle
$q=1-p$, so that $1=$ full proportionality.
$\equiv$ Loosemore, J. and Hanby, V. J. (1971).
The Theoretical Limits of Maximum Distortion: Some Analytical Expressions for Electoral Systems.
British Journal of Political Science, 1.

## Measuring proportionality

We use a metrics introduced by Loosemore and Hanby (1971):

Sum for each party of the number of voters to add or remove to obtain full proportionality.
$\Leftrightarrow$ sum of the areas above and below the proportionality circle
$q=1-p$, so that $1=$ full proportionality.
目
Loosemore, J. and Hanby, V. J. (1971).
The Theoretical Limits of Maximum Distortion: Some Analytical Expressions for Electoral Systems.
British Journal of Political Science, 1.
Alternative interpretation: proportion of deputies that stay in place if we have to make the parliament fully proportional.

## Measuring proportionality

We use a metrics introduced by Loosemore and Hanby (1971):

## $p$ measure of proportionality

Sum for each party of the number of voters to add or remove to obtain full proportionality.
$\Leftrightarrow$ sum of the areas above and below the proportionality circle
$q=1-p$, so that $1=$ full proportionality.
目
Loosemore, J. and Hanby, V. J. (1971).
The Theoretical Limits of Maximum Distortion: Some Analytical Expressions for Electoral Systems.
British Journal of Political Science, 1.
Alternative interpretation: proportion of deputies that stay in place if we have to make the parliament fully proportional.

- Purely proportional voting rule, 577 deputies: $q=0.99$
- Current electoral system: $q=0.67$

## First scenario

No redistricting, $15 \%$ proportionality (678 deputies)

Purely majoritarian

$$
(q=0.67)
$$

Additive mixed

$$
(q=0.72)
$$

## First scenario

No redistricting, $15 \%$ proportionality (678 deputies)

Corrective mixed
$(q=0.75)$

Compensatory mixed

$$
(q=0.8)
$$

## Second scenario

Purely majoritarian, reduction of the number of deputies:

- 577 deputies: $q=0.67$
- 404 deputies: $q=0.66$
- 364 deputies: $q=0.65$
- 344 deputies: $q=0.65$
- 323 deputies: $q=0.65$
- 303 deputies: $q=0.65$
(With statistical generation of voters)

## Third scenario

404 deputies, $15 \%$ proportionality (344 maj. +60 prop.)

Mixed additive $(q=0.73)$

Mixed corrective ( $q=0.75$ )

## Third scenario

404 deputies, $15 \%$ proportionality ( 344 maj. +60 prop.)

Mixed compensatory ( $q=0.77$ )

Purely majoritarian, for comparison ( $q=0.67$ )

## Conclusion

A lot more scenarios tested... (see report for details)
http://recherche.noiraudes.net/resources/2018-05-28-rapport.pdf

## Conclusion

A lot more scenarios tested... (see report for details)
http://recherche.noiraudes.net/resources/2018-05-28-rapport.pdf

Conclusions...

- Reducing the number of deputies strengthens the majority
- Introducing proportionality has the opposite effect

Not much more we can say for sure...
